HubSpot Import Formatter

Killing CRM duplicates at the source — any rep spreadsheet becomes a clean HubSpot import in minutes.

Live for a 50+ rep GTM org — every import Batch-ID tagged and KPI-tracked

dedup

CRM hygiene

Overview

Reps at a global HR-tech (EOR) platform bulk-imported hand-made spreadsheets in inconsistent formats — data-vendor exports, social-selling lists, partner lists — and the CRM couldn't dedupe reliably, polluting records with duplicate contacts and companies, inflating forecasts, and splitting activity history. This Claude skill converts any rep spreadsheet into the company's official import templates: auto-splitting people from companies, deduping pre-import, semantically mapping messy industry values to the CRM's taxonomy enriched with NAICS sector + code, normalizing dropdowns and countries, flagging (never silently dropping) rejected rows, and optionally upserting directly to the CRM with static/active list creation. Live for a 50+-person GTM org, with every import tagged by a Batch ID so data-quality discipline is reportable back to deal attribution.

The Problem

Reps at a global HR-tech (EOR) platform bulk-imported hand-made spreadsheets in wildly inconsistent formats. The CRM's native dedupe couldn't catch near-matches across formats, so it filled with duplicate contacts and companies — inflating pipeline forecasts and splitting activity/engagement history across records that should have been one.

How It Works

1. **Ingest any spreadsheet** — a rep uploads a data-vendor, social-selling, or partner-list export in whatever shape it arrived (Claude skills are reusable, packaged instruction sets that run inside Claude/Claude Code).

2. **Auto-split people from companies** — the skill detects whether rows are person-level, company-level, or mixed, and separates them into the CRM's two-object model.

3. **Pre-import dedupe** — records are deduped against the upload batch itself and (when upserting live) against existing CRM records, before anything touches the system of record.

4. **Semantic industry mapping** — messy free-text industry values are mapped to the CRM's official industry taxonomy and enriched with the matching **NAICS sector + code** — the US government's standard industry classification, which most CRMs don't natively carry.

5. **Normalization** — country names, state/province codes, and dropdown-field values are standardized to exactly what the CRM's properties expect, so imports don't silently fail on mismatched picklist values.

6. **Flag, never drop** — any row that can't be confidently mapped or deduped is flagged in a rejects tab with a reason, so nothing disappears without a human seeing why.

7. **Deliver two ways** — export official import-ready Excel/CSV templates for manual upload, or (if authorized) upsert directly to the CRM via the import API with automatic static/active list creation, tagging the import with a **Batch ID** used as the CRM import name.

Stack & Integrations

Tool	Role	Access needed
Claude skill	Ingest, split, dedupe, map, normalize logic	Claude Code / Claude with skill installed
Excel/CSV processing	Reads rep exports, writes official import templates	Local file access
NAICS mapping layer	Sector + code enrichment on industry values	Ships with the skill (static reference table)
CRM import API (HubSpot)	Optional direct upsert + static/active list creation	Private-app token scoped to contacts/companies + imports
Run ledger	Tracks adoption, volume, data-quality KPIs per Batch ID	Local file or CRM custom object

Setup Process

1. Install the skill into the team's Claude Code / Claude environment.
2. Load your official import template schema and an industry-to-NAICS mapping table (ships with the skill; extend as needed).
3. Configure the CRM private-app token if direct upsert is wanted (read/write contacts + companies, imports API); otherwise the skill exports templates only.
4. Run a test import from a real rep spreadsheet in "export only" mode; review the rejects tab.
5. Enable direct upsert for a pilot team; confirm Batch IDs appear as CRM import names and the run ledger logs volume/quality.
6. Roll out to the full GTM org with a short rep-facing how-to.

What You Need

- [] Claude Code or Claude access for the team
- [] An official import template schema (or your own equivalent)
- [] Optional: CRM private-app token (contacts/companies read-write, imports API) for direct upsert
- [] ~2–3 hours to configure and pilot; minutes per import thereafter

Results

- **Live for a 50+-person GTM org.**
- Every import carries a Batch ID used as the CRM import name — deal attribution back to clean-data discipline is reportable.
- Built-in run ledger tracks adoption, volume, and data-quality KPIs over time.
- Root-cause fix for CRM duplication rather than a downstream cleanup tool.

Challenges & Fixes

- **Inconsistent source formats across vendors** → auto-detection of person vs. company rows instead of requiring a fixed template from reps.
- **Free-text industry values that the CRM's picklist can't match** → semantic mapping layer enriched with NAICS sector + code.
- **Silent import failures on bad dropdown values** → explicit normalization pass before export/upsert.
- **Risk of quietly dropping unmappable rows** → every uncertain row flagged in a rejects tab with a reason, never silently discarded.

Demonstrates

Root-cause data-quality engineering · adoption-aware design (make the standard the easy path) · measurable-by-default tooling · semantic-to-deterministic mapping (LLM interprets messy text, static taxonomy governs the outcome).

Excel/CSV

WHAT IT NEEDS

- ✓ Claude Code or Claude access for the team
- ✓ An official import template schema
- ✓ Optional: CRM private-app token (contacts/companies read-write, imports API)

DISCUSS THIS BUILD

Happy to walk through the architecture, the failures along the way, or how this could translate to your team.
