Post-Sales Call Automation

Four AI agents on every sales call — follow-up email, missed questions, competitor intel, and a CRM note, with zero rep action.

Every sales call → 5 AI deliverables, zero rep action

Avoma

Azure Blob Storage

Outlook

multi-agent

sales follow-up

Overview

An always-on, multi-agent pipeline that turns every recorded sales call into a rep-ready follow-up package. Triggered by a webhook after each call, it pulls the Avoma transcript, detects which countries the buyer wants to hire in, fetches exact country employment-law files from Azure Blob Storage, and runs four AI agents: a consultative "If I Were You" follow-up email, a missed-questions analysis, competitor research, and a LinkedIn draft — then emails the rep via Outlook and logs a note to the HubSpot deal. Built for a global HR-tech (EOR) platform where country-specific facts win deals. Result: five deliverables per call, zero rep action.

The Problem

At a global HR-tech (EOR) platform (~500 employees, operating in 160+ countries), reps left sales calls without consistent follow-ups, missed buyer questions went unnoticed, and country-specific facts — the heart of Employer-of-Record selling — varied from rep to rep. Follow-up quality depended entirely on individual discipline.

How It Works

1. **Webhook trigger (Avoma → n8n cloud)** — a call-recording webhook fires after every sales call; n8n is a workflow-automation platform that runs the pipeline always-on, regardless of whose laptop is off.
2. **Meeting guard + transcript polling** — a completed-meeting check skips future/scheduled meetings; a bounded wait loop (20 polls × 2 min, ~40 min budget) retries until the transcript is ready, then exits gracefully instead of dead-ending.
3. **Country extraction → ISO-3 codes** — an LLM step reads the transcript and extracts only countries with real hiring intent (max 8, hard cap 10), mapping each to its ISO-3 code (Germany → DEU).
4. **Deterministic country-data fetch** — exact files are pulled from Azure Blob Storage (`country-data/<ISO3>.md` , 250+ countries) — cloud file storage, anonymous read, no index, no tokens to rotate. A context-builder step strips internal noise before injection.
5. **Four Azure OpenAI agents** — enterprise-hosted GPT models draft the follow-up email, missed-questions analysis, competitor research, and LinkedIn post, each with an explicit "specificity requirement" (cite concrete facts like "13th-month pay split 50% June / 50% December," never generic filler).
6. **Delivery** — Outlook (Microsoft's email service) sends the package to the rep and sales leadership; the HubSpot API logs a note to the associated deal.

Stack & Integrations

Tool	Role	Access needed
n8n (cloud)	Workflow engine, always-on	n8n cloud workspace, webhook enabled
Avoma	Call recording + transcript API	Avoma API key (read meetings/transcripts)
Azure OpenAI	4 LLM agents + country extraction	Azure OpenAI deployment + API credential
Azure Blob Storage	250+ country data files (<code><ISO3>.md</code>)	Anonymous-read container (or SAS if private)
HubSpot API	Deal/contact lookup, note creation	Private app / OAuth with CRM read + notes write
Microsoft Outlook	Email delivery to reps	Microsoft 365 OAuth connection in n8n

Setup Process

1. Import the workflow JSON into n8n (imports inactive).

2. Re-link credentials on each node: Azure OpenAI models, HubSpot, Outlook, Avoma HTTP nodes.
3. Stage country data files in a blob container named by ISO-3 code.
4. Register the n8n webhook URL as the post-call trigger.
5. Dry-run with a saved real webhook body, email routed only to yourself.
6. Verify context assembly size and agent output specificity, then activate and widen the recipient list.

What You Need

- [] n8n cloud workspace · Avoma API access · Azure OpenAI deployment
- [] Azure Blob container with country markdown files
- [] HubSpot private-app scopes (deals/contacts read, notes write) · Outlook OAuth
- [] ~2–4 hours to deploy and dry-run

Results

- **Live in production** — every call auto-produces 5 deliverables (email, missed questions, competitor intel, LinkedIn draft, HubSpot note) with zero rep action.
- Rebuilt from **21/25 executions failing** → **2/2 verified end-to-end passes** (0/25 previously reached the email step).
- Verified on a real three-country South America call: **116K characters** of live country context assembled.
- Extraction tightening: **20 → 6 countries** per call, context **882KB → 295KB** (~74K tokens) — lower cost, better signal.

Challenges & Fixes

- **Azure AI Search vector index died (84% of failures)** and couldn't be recreated due to permissions → removed the RAG layer entirely; replaced with deterministic blob fetch (country code → exact file). The failure point was deleted, not patched.
- **Silent wait-loop dead-ends** → future-meeting guard, count-zero retry path, 10 → 20 poll budget, explicit End nodes.
- **Paired-item lineage break lost the transcript** → context builder carries base fields forward; all 28 fragile per-item references converted to pairing-immune ones.
- **Generic, templated output** → stripped internal noise from country files and enforced a specificity requirement on all four agents.

Demonstrates

Event-driven multi-agent pipelines · pragmatic RAG-vs-deterministic judgment · graceful degradation · production debugging from execution forensics.

STACK & INTEGRATIONS

n8n

Avoma

Azure OpenAI

Azure Blob Storage

HubSpot

Microsoft Outlook

WHAT IT NEEDS

- ✓ n8n cloud workspace with webhooks enabled
- ✓ Avoma API access (read meetings/transcripts)
- ✓ Azure OpenAI deployment + credential
- ✓ Azure Blob Storage container with country data files (ISO-3 named)
- ✓ HubSpot private app (deals/contacts read, notes write)
- ✓ Microsoft 365 / Outlook OAuth connection

DISCUSS THIS BUILD

Happy to walk through the architecture, the failures along the way, or how this could translate to your team.
