Pre-Call Briefing Automation

An AI briefing in the rep's inbox before every sales meeting — so no one walks in cold.

Context-rich AI brief in the rep's inbox before every scheduled meeting, with built-in dedupe

Overview

The companion to Post-Sales Call Automation — together they bracket every sales call with AI. This n8n workflow watches for upcoming sales meetings, assembles everything the rep should know — contact, company, deal, and buyer-intent signals from the CRM — and has an enterprise LLM draft a structured pre-call brief. The brief lands in the rep's inbox before the meeting and is logged to the CRM as a note and a contact property, with dedupe logic so no meeting is briefed twice. Ships with an exec-readable one-pager, a slide deck brief, and an architecture diagram — every stakeholder sees the same picture.

The Problem

Reps at a global HR-tech (EOR) platform walked into discovery calls cold. Context existed — deal records, contact history, intent data — but it was scattered across CRM objects and third-party tools, and nobody had time to assemble it before every meeting.

How It Works

1. **Webhook trigger + payload normalization** — a webhook fires into n8n (a workflow-automation platform) with a contact or meeting event; a Code node normalizes the payload so downstream steps see one consistent shape.

2. **Contact and meeting resolution (CRM API)** — the workflow resolves the contact (adopting the meeting's contact if no ID arrived), extracts associations, and batch-reads associated meetings to pick the next upcoming one. The CRM is the system of record for contacts, companies, and deals.
3. **Dedupe guard** — an "existing brief" check verifies the meeting hasn't already been processed, so reps never get duplicate briefings.
4. **Context gathering** — parallel CRM lookups pull the company, the deal, and the rep (owner), plus a **buyer-intent platform** — showing which accounts are actively researching — all merged into one context object.
5. **AI brief drafting** — an LLM agent with a structured output parser (enterprise-hosted model, forced into a predictable JSON shape) drafts the pre-call brief from the assembled context.
6. **Delivery + CRM logging** — the brief is formatted into an email and sent to the rep; a CRM note is created and a pre-call-notes contact property is updated so the brief lives on the record too.

Stack & Integrations

Tool	Role	Access needed
n8n	Workflow engine (26-node pipeline)	n8n workspace, webhook enabled
CRM API (HubSpot)	Contacts, meetings, companies, deals, owners, notes, properties	Private app / OAuth with CRM read + notes/properties write
Buyer-intent platform (Factors.ai)	Intent signals for the account	API access (read intent data)
Enterprise LLM (Azure OpenAI)	Brief-drafting agent + structured output parser	Deployment + API credential
Email (Outlook)	Briefing email to the rep	Microsoft 365 OAuth connection in n8n

Setup Process

1. Import the pre-call workflow JSON into n8n (imports inactive).
2. Re-link credentials: CRM, LLM, email, and the buyer-intent HTTP request.
3. Create/confirm the CRM pre-call-notes contact property the workflow writes to.
4. Register the webhook URL against the meeting/contact trigger source.
5. Dry-run with a test contact that has an upcoming meeting; confirm the dedupe guard passes then blocks a second run.

6. Review a sample brief for accuracy, then activate for the team.

What You Need

- [] n8n workspace · CRM private-app scopes (contacts, meetings, companies, deals, owners read; notes/properties write)
- [] Enterprise LLM deployment · buyer-intent platform account with API access · email OAuth
- [] ~2–3 hours to deploy and dry-run

Results

- Shipped as a complete package: production workflow JSON, slide-deck brief, stakeholder one-pager, and architecture diagram.
- Designed to put a context-rich briefing in front of the rep before every scheduled sales meeting — automatically, with built-in dedupe.
- Together with Post-Sales Call Automation, brackets the entire sales-call lifecycle with AI (brief before, follow-up after).

Challenges & Fixes

- **Inconsistent trigger payloads** → a normalization Code node up front, plus an adopt-the-meeting-contact fallback when no contact ID arrives.
- **Risk of duplicate briefings** → explicit "existing brief" gate before any AI spend.
- **Free-form LLM output** → structured output parser forces a stable JSON schema before the email formatter runs.

Demonstrates

End-to-end ownership of the sales-call lifecycle · intent-data enrichment in a CRM path · stakeholder communication — every build ships with an exec-readable brief.

STACK & INTEGRATIONS

n8n

HubSpot

Azure OpenAI

Factors.ai

Outlook

WHAT IT NEEDS

- ✓ n8n workspace
- ✓ CRM private-app scopes (contacts, meetings, companies, deals, owners read; notes/properties write)

- ✓ Enterprise LLM deployment
- ✓ Buyer-intent platform account with API access
- ✓ Email OAuth connection

DISCUSS THIS BUILD

Happy to walk through the architecture, the failures along the way, or how this could translate to your team.
